LEXICON

Exercises: MongoDB basics

Do all exercises in Python, with the header from the code-along at the top of your file. Start by running python seed_webshop.py. Exercises 7 and 8 add data: when you are done, run python seed_webshop.py to reset the webshop.

The header (at the top of every Python file):

```
from pymongo import MongoClient

client = MongoClient("mongodb://localhost:27017/")
db = client["webshop"]
```

Exercise 1

Print the name of every product in the Accessories category.

Expected: 4 names

Exercise 2

Print the first and last name of every customer who lives in Göteborg.

Expected: 2 customers

Exercise 3

Python: print the name and price of every product, one per line.

Expected: 12 lines

Exercise 4

Python: how many customers live in Uppsala? Use count_documents.

Expected: 3

Exercise 5

Python: find the product named Sandals with find_one and print how many are in stock.

Expected: 22

Exercise 6

Python: print the first name of every customer who gets the newsletter (newsletter is True).

Expected: 3 names

Exercise 7

Python: add yourself as a customer with insert_one, without an _id. Print the inserted_id. Then find yourself again with find_one and your email, and print yourself with pprint.

Expected: an ObjectId, then your document

Exercise 8

Python: add two new products with insert_many (give them _id 13 and 14, and include tags). Then print how many products there are.

Expected: 14

Exercise 9

Python: print every customer as 'First Last (City)'. Customers without a city should show (unknown). Hint: dict.get().

Expected: 10 lines

Exercise 10

Challenge: print every order as 'Order 1: 2 items'. Hint: an order's items is a list, and len() works on lists.

Expected: 15 lines
